Sabbatia angularis

Swain & Smith

SABBATIA ANGULARIS.

American Centaury.

PLATE LVII.

UNDER the name of *Chironia angularis*, this plant has been familiar to physicians in the United States as a native bitter. As it wants the most distinguishing characters of Chironia, while it has others of a very different kind, particularly in the anthers and stigma; I have followed the example of Pursh and others in referring it to the genus Sabbatia of Adanson.

This genus is characterised by *a persistent calyx from five to twelve parted; a corolla from five to twelve parted; anthers finally revolute; stigma two parted, spiral; capsule one celled.* The Sabbatia angularis differs from the rest of the genus in being erect, the leaves clasping, peduncles elongated and corymbose, segments of the calyx lanceolate, half as long as the corolla; stem square and winged.
